

Name _____ Date _____ Period _____

Transformations of $f(x) = |x|$, Part I

Algebra II | Unit 2 | Day 2 | TEK A2.6.C

Objective: I can describe and graph the effect of a and b on $f(x) = a|bx|$ - vertical/horizontal stretches, compressions, and reflections.

Vocabulary

Vertical stretch/compression: $af(x)$; $|a| > 1$ _____ away from the x-axis, $0 < |a| < 1$ _____ toward it.

Horizontal stretch/compression: $f(bx)$; $|b| > 1$ _____ toward the y-axis, $0 < |b| < 1$ _____ away from it.

Reflection: $a < 0$ flips over the _____; $b < 0$ flips over the _____.

KEY IDEA

a in $f(x) = a|x|$: $|a| > 1$ stretches, $0 < |a| < 1$ compresses, $a < 0$ reflects over the x-axis.

b in $f(x) = |bx|$: $|b| > 1$ compresses, $0 < |b| < 1$ stretches, $b < 0$ reflects over the y-axis.

The vertex never moves from _____ no matter what a or b is.

Let's Work Through It

Example 1 — Describe $f(x) = 2|x|$, compared to the parent function.

Effect: _____ Vertex: _____

Example 2 — Describe $f(x) = (1/2)|x|$.

Effect: _____ Vertex: _____

Example 3 — Describe $f(x) = -|x|$.

Effect: _____ Vertex: _____

Example 4 — Describe $f(x) = |3x|$, then describe $f(x) = |(1/2)x|$.

$f(x) = |3x|$: _____ $f(x) = |(1/2)x|$: _____

Example 5 — Graph $f(x) = 2|x|$. Each square is 1 unit; both axes run -5 to 5. Is it steeper or flatter than the parent?

Steeper or flatter: _____

Your Turn

You Try 1 — Describe $f(x) = -4|x|$. It combines two effects.

Effect: _____

You Try 2 — True or False: $f(x) = |-5x|$ looks different from $f(x) = 5|x|$. Explain.
